# Technical Report

## AI Data Analyst Agent for CSV-Based Analysis

---

# 1. System Architecture

The AI Data Analyst Agent is an end-to-end, modular system designed to perform **structured, safe, and reproducible analysis** on user-uploaded CSV datasets. The system follows a **Planner–Validator–Executor–Explainer** architecture and is implemented as an interactive **Streamlit web application**.

The core design principle is a strict separation between **LLM-based reasoning** and **deterministic data execution**, ensuring transparency, traceability, and reproducibility.

---

### 1.1 Architectural Overview

The system consists of five core components:

1. **User Interface (Streamlit)**
   - CSV file upload and preview
   - Natural language query input
   - Display of analysis plans, tables, charts, and insights
2. **Dataset Analyzer**
   - Extracts schema-level information (column names, data types, sample values)
3. **Planner Agent (LLM-based)**
   - Converts user questions into structured JSON analysis plans
4. **Execution Engine (Deterministic Python)**
   - Executes validated plans using Pandas
   - Generates visualizations using Plotly
5. **Explainer Agent (LLM-based)**
   - Generates business-friendly insights from execution results

---

### 1.2 End-to-End Pipeline Flow

Insights Display

This architecture ensures clear separation of responsibilities, traceability of decisions, and reproducible analytics.

---

# 2. Pipeline Execution

## 2.1 Data Ingestion

- Users upload a CSV file through the Streamlit interface
- The dataset is loaded using Pandas
- Basic validation is applied (file type, encoding, column presence)

**Output:** Clean Pandas DataFrame and dataset preview

---

## 2.2 Dataset Understanding

- Schema information (column names, data types, sample values) is extracted
- Only schema-level metadata is shared with the Planner Agent

**Benefit:** Prevents hallucinated columns or invalid operations

---

## 2.3 Query Input

- Users ask analytical questions in natural language
- No SQL or programming knowledge is required

---

## 2.4 Planning

- The Planner Agent generates a **strictly valid JSON analysis plan**
- The planner never executes code or accesses raw data values
- Planner temperature is set to **0.0** to ensure deterministic JSON generation

---

### 2.5 Validation

- Generated plans are validated against:
  - Allowed analytical operations
  - Valid dataset columns
  - Safe aggregation functions
  - Visualization constraints
- Invalid plans are rejected before execution

---

### 2.6 Execution

- The validated plan is executed deterministically using Pandas
- Charts are generated using Plotly
- Results are fully traceable to the JSON plan

---

### 2.7 Explanation

- The Explainer Agent converts numerical results into business-friendly insights
- Outputs include ranked findings and actionable takeaways

---

# 3. Agent Responsibilities and Interactions

The system follows a multi-agent design where each agent has a single, clearly scoped responsibility. This separation improves modularity, safety, and maintainability.

---

### 3.1 Planner Agent

**Purpose:**

The Planner Agent is responsible for reasoning and decision-making. It translates natural language questions into structured, machine-readable JSON analysis plans without performing any computation.

**Inputs:**

- User’s natural language question
- Dataset schema metadata
- Predefined allowed operations and constraints

**Responsibilities:**

- Interpret analytical intent (aggregation, comparison, trends, correlation)
- Identify relevant dataset columns
- Define filters, group-by fields, metrics, sorting, and visualization configuration
- Attach user intent metadata (highest, lowest, both)
- Sanitize and normalize plans to remove unsafe or invalid instructions

**Key Design Characteristics:**

- Uses an LLM only for planning and reasoning
- Outputs JSON only, never executable code
- Does not access raw dataset values

**Interaction:**

- Sends validated JSON plans to the Validation layer

---

## 3.2 Executor Agent

**Purpose:**
The Executor Agent performs deterministic and reproducible execution of validated analysis plans.

**Inputs:**

- Validated JSON plan
- Original dataset (Pandas DataFrame)

**Responsibilities:**

- Apply filters safely with numeric coercion
- Perform group-by and aggregation operations
- Apply sorting and Top-N logic deterministically
- Generate structured result tables
- Generate Plotly visualizations

**Key Design Characteristics:**

- No LLM usage
- No dynamic code execution
- Only predefined Pandas and Plotly operations are allowed

**Interaction:**

- Outputs results to the Explainer Agent

---

### 3.3 Explainer Agent

**Purpose:**
The Explainer Agent communicates analytical results in a clear, concise, and business-friendly manner.

**Inputs:**

- User’s original question
- Execution results and rankings
- Contextual metadata from the plan

**Responsibilities:**

- Interpret numerical outputs
- Identify meaningful patterns and extremes
- Generate concise insights grounded strictly in execution results

**Key Design Characteristics:**

- Uses an LLM only for explanation
- Prevents hallucination by restricting inputs

---

### 3.4 Dataset Analyzer (Supporting Component)

**Purpose:**
Provides schema-level understanding of uploaded datasets.

**Responsibilities:**

- Extract column names and data types
- Generate compact schema summaries
- Assist planning and validation stages

---

# 4. Planning Schema and Execution Safeguards

### 4.1 JSON Planning Schema

Each plan explicitly defines:

- Analysis type
- Filters
- Group-by columns
- Metrics
- Sorting rules

- Visualization configuration
- User intent metadata

---

### 4.2 Validation Rules

- Allowed operations only
- Valid dataset columns
- Safe aggregation functions
- Visualization constraints

Invalid plans are rejected prior to execution.

---

### 4.3 Execution Safeguards

- No LLM-generated code is executed
- Only Pandas and Plotly operations are permitted
- Safe numeric coercion is enforced
- Deterministic execution is guaranteed

---

# 5. End-to-End Application

The Streamlit application provides:

- CSV upload and validation
- Natural language query interface
- Display of dataset preview
- Display of JSON analysis plans
- Tables and visualizations
- Final natural-language insights
- Session-level query history

---

# 6. Evaluation Protocol

The system was evaluated using a combination of **automated** and **human** evaluation:

- **Automated evaluation:** verifies schema compliance, execution correctness, and deterministic behavior
- **Human evaluation:** assesses clarity, usefulness, and faithfulness of generated insights

Evaluation configurations are defined declaratively in `experiments/*.yaml`.

---

# 7. Conclusion

This project demonstrates a production-style AI analytics system by combining:

- LLM-based reasoning for planning and explanation
- Deterministic Pandas execution for reliability
- Modular agent design for maintainability

By enforcing deterministic execution and declarative experiment definitions, the system provides strong reproducibility guarantees and aligns with modern AI-powered business intelligence practices.

---

# Appendix: Modular Agent Design – Pseudocode

```
START APPLICATION
LOAD Streamlit User Interface
WAIT for user to upload CSV dataset
WAIT for user to enter a natural language question

IF dataset and question are provided:
   SCHEMA ← analyze_dataset(dataset)
   PLAN ← PlannerAgent.generate_plan(SCHEMA, question)
   VALIDATE PLAN against schema and dataset columns

   IF plan is valid:
      RESULTS, CHARTS ← Executor.execute_plan(dataset, PLAN)
      INSIGHTS ← ExplainerAgent.generate_insights(question, RESULTS)
      DISPLAY results, charts, and insights
   ELSE:
      DISPLAY validation error
END
```

Key Insights
The dataset is about sales orders for a product called "Motorcycles" from various customers across different countries.
• The dataset contains 2823 total rows of data, indicating a large number of sales orders. • The majority of customers (count: 12) are from the USA, with France being the second most represented country (count: 4). • The "Motorcycles" product line is the only one present in the dataset, with no other product lines being sold. • The majority of deals (count: 11) are classified as "Medium" in size, followed by "Small" (count: 5) and then "Large" is not present in the dataset. • The dataset spans across 2003 and 2004, with the majority of orders (count: 12) being placed in the fourth quarter of 2003.

USA
UK
COUNTRY
Key Insights
Sales in the USA are significantly higher than in the UK.
• The USA generated 3,627,982.83 in sales, which is more than 7.5 times the sales of the UK.
• The UK generated 478,880.46 in sales. • The USA accounts for approximately 88% of the total sales between the two countries. • The sales difference between the USA and the UK is substantial, with the USA having a sales advantage of $3,219,102.37. • The USA is the dominant market in terms of sales compared to the UK.

SALES
YEAR_ID
Key Insights
Sales trend analysis by year_id shows that sales have fluctuated over the years.
• Sales in 2004 were the highest at 4,724,162.
• Sales in 2003 were significantly higher than in 2005, with 3,516,979 compared to 1,791,487.
• There is a notable decrease in sales from 2003 to 2005, with a drop of 2,725,492. • The sales trend does not show a consistent increase or decrease over the years. • The data only includes three years, making it difficult to draw long-term conclusions.

COUNTRY
Key Insights
Direct Answer and key insights: There is a correlation between sales and country, with the USA having the highest average sales. The top countries by average sales are USA, France, and Norway.
• The USA has the highest average sales at 3,434.45, with a total of 7 orders.
• France has an average sales of 3,144.11, with a total of 3 orders. • Norway has an average sales of $5,512.32, with a total of 1 order. • The country with the lowest average sales is not specified in the data, but it is clear that there is a significant variation in sales across different countries. • The correlation between sales and country suggests that there may be regional differences in customer behavior or market conditions that are driving sales.

Key Insights
Distribution of sales: The sales are primarily concentrated in the range of 2,500 to 5,500, with a few orders exceeding $5,500. The majority of the sales are in the medium deal size category.
• The top sales value is 8,212.32, which is the highest sales value in the dataset.
• The majority of the sales (63%) are in the medium deal size category, with 45% of the orders having a quantity ordered between 36 and 49.
• The average sales value is 2,444.19, with a median sales value of 2,768.94.
• The sales are primarily concentrated in the range of 2,500 to $5,500, with 71% of the orders having a sales value within this range. • The top sales value is from an order with a quantity ordered of 48, indicating that larger orders tend to have higher sales values.

There are 13 countries starting with the letter B.
• The countries starting with B are: • Bangladesh • Belarus • Belgium • Benin • Bhutan • Bolivia • Bosnia and Herzegovina • Botswana • Brazil • Brunei • Bulgaria • Burkina Faso • Burundi
• The list of countries starting with B includes countries from various continents, including Asia, Europe, and Africa.
• The country with the largest population starting with B is Brazil, with a population of over 214 million people.
• The country with the smallest population starting with B is Bhutan, with a population of approximately 771,608 people.

Key Insights
There are 10,000 students in this dataset.
• The number of students is a fixed value, indicating a complete dataset. • No additional information is available about the students, such as demographics or academic performance. • The dataset does not provide any context about the students, such as their location or academic level. • The count of students is a single value, suggesting that there is no variation or distribution of students in the dataset. • Further analysis would be required to understand the characteristics of the students.
